

# LENDING CLUB CASE STUDY

---

DINESH CHAUDHARY  
MANASA MARATHE

# Lending Club

- Lending Club is a marketplace for personal loans that matches borrowers who are seeking a loan with investors looking to lend money and make a return.
- The company has to approve loans for the applications received, considering the fact that the invested amount doesn't go in vain.

# Purpose of analysis

- To identify the variables that have more chances of a loan default.
- With this Lending club could identify the potential risks involved when a loan is applied and utilise that to showcase their portfolio.

# Data Cleaning

- Before starting the analysis need to drop column with null values and single values columns from the data set has, they have no significance in analysis
- Single Valued columns:
  - 'pymnt\_plan', 'initial\_list\_status', 'collections\_12\_mths\_ex\_med', 'policy\_code', 'application\_type', 'acc\_now\_delinq', 'chargeoff\_within\_12\_mths', 'delinq\_amnt', 'tax\_liens

# Drop the columns which have no significance to the analysis

- Some columns are generated post the approval of loan and since we are analyzing the factors contributing to defaulting before approving the loan , we can simply remove these columns.
- Example of post features are delinq\_2yrs, revol\_bal, out\_prncp, total\_pymnt, total\_rec\_prncp, total\_rec\_int, total\_rec\_late\_fee, recoveries, collection\_recovery\_fee, last\_pymnt\_d, last\_pymnt\_amnt, next\_pymnt\_d, chargeoff\_within\_12\_mths, mths\_since\_last\_delinq, mths\_since\_last\_record
- Other columns like member\_id, id, title , emp\_title, desc, zip\_code, addr\_state, last\_credit\_pull\_d don't contribute to analysis since they are irrelevant.
- funded\_amnt is not needed since we only need the actual amount and same is provide by funded\_amnt\_inv.

# Deriving new columns

- Deriving below columns from existing columns for data analysis
- term\_months -- > by removing 'months' from column term
- int\_rate\_percentage -- > by removing '%' from column int\_rate
- emp\_length\_years -- > by removing 'years', replacing 10+ with 10 and if <1 replacing with 0.5 from column emp\_length
- revol\_util\_percentage -- > by removing '%' from column revol\_util
- issue\_d\_month, issue\_d\_year -- > derived from columns issue\_d, earliest\_cr\_line\_month, earliest\_cr\_line\_year, earliest\_cr\_line
- Profil\_Loss -- > derived from total\_pymnt\_inv, funded\_amnt\_inv

# Univariate Analysis / Categorical Analysis of Data

- Since we need to find the parameters that can derive the loan defaulters , let's consider the univariate analysis for loans which have 'Charged Off' loan status.

# Home ownership analysis

- Inference: There are more chances of defaulting when the applicant is living in rented house

# Purpose analysis

- Inference: Debt consolidation purpose has highest chances of defaults

# Analyzing by issued month and year

- **Inference:** Maximum number of defaults have occurred when the loan was sanctioned in Dec. Defaults for loans issued in the year 2011 were also high as compared to other years

# Cumulative Observations

**From the plots, we noticed that there are more chances of defaulting when :**

- Applicants having house\_ownership as 'RENT'
- Applicants who receive interest at the rate of 13-17%
- Applicants who have an income of range 31201 - 58402
- Applicants with employment length of 10 or more
- When funded amount by investor is between 5000-10000
- Loan amount is between 5429 - 10357
- Dti is between 12-18
- When monthly installments are between 145-274
- Term of 36 months
- When the loan status is Not verified
- When the no of enquiries in last 6 months is 0
- When the purpose is 'debt\_consolidation'
- Grade is 'B'
- And a total grade of 'B5' level.

# Annual Income vs other columns analysis

- debt\_consolidation had highest number of default as seen earlier but the annual income is not highest in that case , instead it is highest in case of home\_improvement purpose
- Applicants with higher salary mostly applied loans for "home\_improvement", "house", "renewable\_energy" and "small\_businesses"

# Cumulative Observations

With the above plot and analysis of charged off loans. We noticed that the applicant has higher chances of defaulting when :

- Applicants taking loan for 'home improvement' and have income of 60k -70k
- Applicants whose home ownership is 'MORTGAGE and have income of 60-70k
- Applicants who receive interest at the rate of 21-24% and have an income of 70k-80k
- Applicants who have taken a loan in the range 30k - 35k and are charged interest rate of 15-17.5 %
- Applicants who have taken a loan for small business and the loan amount is greater than 14k
- Applicants whose home ownership is 'MORTGAGE and have loan of 14-16k
- When grade is F and loan amount is between 15k-20k
- For grade G and interest rate above 20%
- When the loan is verified, and loan amount is above 16k
